It will collect some basic data and some of it is not in the database but there will be extra input fields for the field. I want to pass through the data to the database once the form is submitted, but also keep the entry in case the form is submitted again. Is there a method I can override for the Form.php class in my local code? I'm specifically looking for a method to override, as I'm not sure if I can do it using a custom module. A: Do you mean you want to validate a form in a separate method than the default magento validation? The validation runs in magento\framework\Validator\Adapter\AdapterInterface::validate() method. In this method, you have the possibility to validate a form via an instance of the Magento\Framework\Validator\Validator\ValidatorInterface object. If you look to this method in Magento\Framework\Validator\Adapter\AdapterInterface::validate(), you can see that you have two interesting methods (__call() and setForm()) to override. In your case, you can override the setForm() method to overwrite the form with some custom stuff. But you can validate the form and put the result in a cache. You can create a custom
