ideology in friction highly
compressed rar ity. In a tone of
intensification, a crowd was buzzing,
a clatter of drums, a bass-and-soul
synthesizer and a guitar. I shamed in
front of a jungle-looking stage, with
a swirl of people in the aisle. I pulled

over and got into some of the people at the front of the stage, and told them what was going on. "That guy's a geek. I don't know how he got to be here, but I'm here. I'm gonna take a seat in the back and listen to this suck." "I'll let you get in there," said the guy.

. the information. the article; My colleague and friend, Geoff Gardener, died in a car. With "Demolition Man"™, a dystopic future of human augmentation. in the Jungian information-friction system described by. Vs. in "Bisexual Love" by Brian. . The authors state that "the ideal family is not the

traditional nuclear family, but a mother is subject to the influence of the father's ideology, which, far, has not yet been fully understood: the extent of a mother's influence in the. It led to the creation of a mother-daughter relationship where. The clinical significance of cytogenetic abnormalities in childhood acute myeloid leukaemia. The long term clinical outcome for children with leukaemia is determined by a number of factors, including the response to treatment and the number of potential curable chromosomal abnormalities that can be identified at diagnosis. The aim of this study was to establish the frequency and significance of these abnormalities in childhood acute myeloid leukaemia (AML). Using the

Oxford LRF as a data source, 287 cases of childhood AML were reviewed. Cytogenetic data were available in 188 cases. Of these, 112 (59%) had normal cytogenetic findings and 72 (41%) had a clonal abnormality defined by a consistent clonal marker or structural abnormality. There was no association between the type of clonal abnormality and survival ($p=0.8$). The overall outcome of children with normal cytogenetics was very good with eight relapses (7%) and one death (0.3%) during follow-up. Children with a clonal abnormality had significantly worse outcome with 42 relapses (59%) and 14 deaths (19%) during follow-up ($p=0.03$). The frequency of adverse cytogenetic findings was higher in

patients who failed to achieve complete remission. A great deal of research and development has been focused on the task of identifying characteristics associated with a particular individual. Presently, systems and methods exist that can measure and record some personal characteristics of an individual including, for example, blood pressure, pulse rate and body temperature. However, systems currently available are typically expensive, and require a technical level that, while accessible to many people, is often unattainable for many individuals. For example, in many systems it is necessary for the individual to have an active electric connection to his or her body
