Because of its sheer power, Photoshop's cost has always been prohibitive, for those of us without a corporate sponsor. Piracy did help cut the price, but the pirating of Photoshop is now a truly major problem: they're taking your work and uploading it to their website, where it's not yours to give or sell. The bottom line: Photoshop is as huge, comprehensive, and feature-rich as ever, but it's now outdated on many levels. It provides great functionality, but at the same time it no longer fits into today's collaboration landscape. As a matter of fact, we can safely presume that we will never see a major update or re-design to a core Photoshop feature. Adobe is unlikely to ever add this functionality to Photoshop. The future will bring more features, but those features will always concern details of a feature that can only truly be addressed by creating a new program, such as crowdsourced image editing, which would require a completely new user interface and a whole new set of features. In contrast, the basic editing functions and scripting tools are not that complex; there are already tens of thousands of extensions for all kinds of other programs for things like image enhancement, color correction, type and layout tools, etc. Projects like Brighspot can provide a much-needed, streamlined update. A closer look at the freebie version of Lightroom 5 shows that the users tester for this toolkit is merely a UI redesign that can be ported to any image-editing program. And all this, incidentally, leads us to the good news: Lightroom 5 is the most important update Photoshop has ever seen. Lightroom 5 gets hundreds of new features out of the box and that, combined with the extensive functionality already present in PS, will finally bring photos to life.
